

F-TALENT CODE 2026**Divisible Pairs**

Time Limit: 1 second

Memory Limit: 256 MB

Problem Statement

You are given a sequence of n distinct positive integers. Find all pairs of numbers (a, b) from the sequence such that one of them divides the other (i.e., a divides b or b divides a).

For each such pair, output it in the form (smaller number, larger number).

The pairs must be printed in increasing order of the smaller number; if the smaller numbers are equal, then in increasing order of the larger number. Pairs are separated by a single space.

If there are no such pairs, output an empty line.

Input

The first line contains a single integer n ($1 \leq n \leq 100$) — the number of elements in the sequence.

The second line contains n distinct positive integers $a_1, a_2, \dots, a_n$ ($1 \leq a_i \leq 10^6$).

Output

Print a single line containing all valid pairs in the required format (or an empty line if none exist).

Example 1:

INPUT	OUTPUT
5 3 4 5 6 8	(3, 6) (4, 8)

Explanation: 6 is divisible by 3, and 8 is divisible by 4. No other pairs satisfy the condition.

Example 2:

INPUT	OUTPUT
4 1 2 3 6	(1, 2) (1, 3) (1, 6) (2, 6) (3, 6)

Explanation: 1 divides every integer. Additionally, 2 divides 6 and 3 divides 6.

Note

- All numbers in the input are positive and pairwise distinct.
- A number is never paired with itself.
